

Intrinsic universality and the computational power of self-assembly

Damien Woods

Caltech

Computation and geometry

Rule 110 - from Cook. Complex Sys 2004.

Abstract tile assembly model. Winfree 1998

Portion of a tiling of Robinson's
10-tile aperiodic square tile set

Nubots - From Woods, Chen , Goodfriend, Dabby, Winfree, Yin. ITCS 2013

Physical motivation

- Engineers are building nanoscale molecular (chemical) computers

Rothemund, PWK. Folding DNA to create nanoscale shapes and patterns. Nature 2006

Rothemund, Papadakis, Winfree 2004

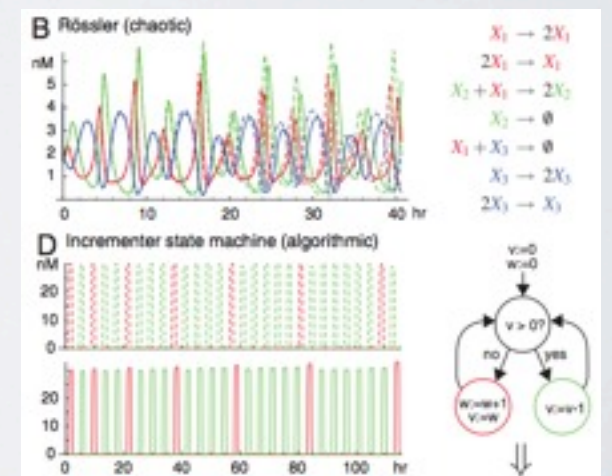

- Nature computes

“Indeed, if the physics of our universe could not support computation, it’s doubtful that it could support life”
Moore & Mertens. “The Nature of Computation” 2012

Sumazin et al. Cell 147(2). 2011

- We need a computational theory of self assembly and molecular interactions
- Prediction in science
- More importantly (for us), we can find interesting theoretical problems involving computation, geometry, asynchronosity, kinetics and thermodynamics

Soloveichik, Seelig, Winfree. DNA as a Universal Substrate for Chemical Kinetics. PNAS 2010

Our journey

Our journey

aTAM, $\tau \geq 2$ (IU [11])

Abstract tile assembly model

- Finite set of unit-sized square **tiles**
 - non-rotatable, unlimited supply of each tile type
- Each side has a **glue** (a,b,c,d,...)
- Each glue has a **strength** (0,1,2,3,...)
- **Tile assembly system**: is a [tile set, seed tile, temperature (0,1,2,3,...)]
- Growth begins from the **seed** tile at (0,0) in \mathbb{Z}^2
- A tile **sticks** to an assembly if enough of its glues match so that the sum of the strengths of the matching glues is at least the **temperature**
- Asynchronous

Rothemund, Papadakis, Winfree 2004

Key definition: Tile assembly system: tile set, seed tile, temperature

Abstract tile assembly model

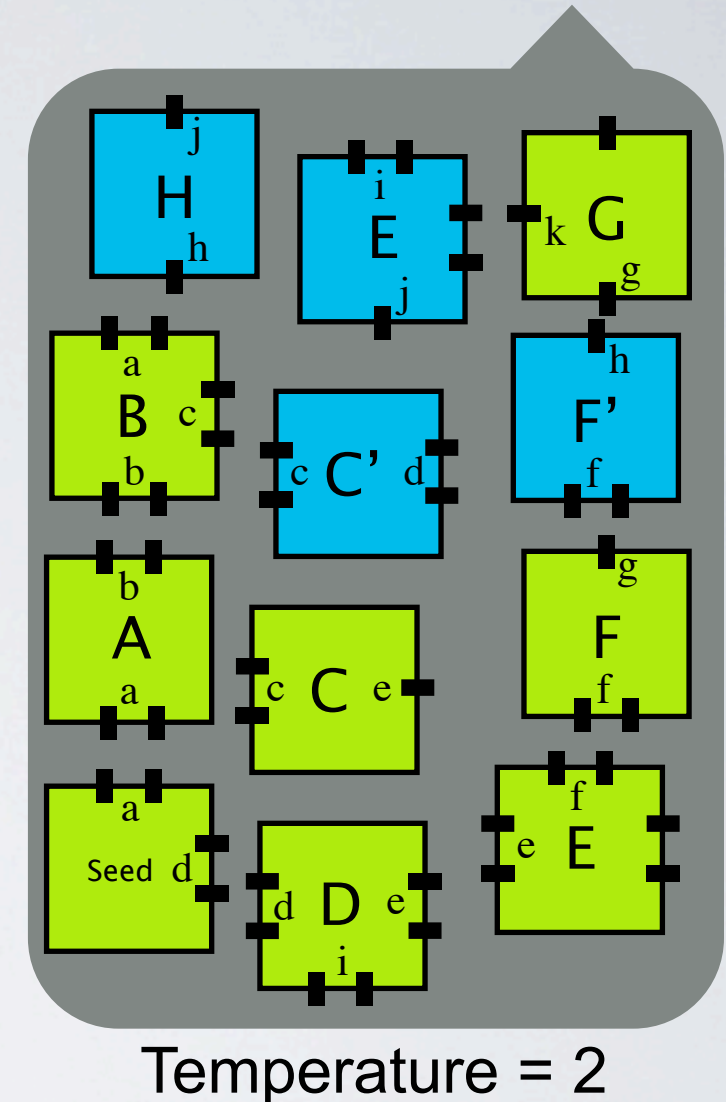

Tile assembly system:
tile set, seed tile, temperature

- Finite set of unit-sized square **tiles**
- non-rotatable, unlimited supply of each tile type
- Each side has a **glue** (a,b,c,d,...)
- Each glue has a **strength** (0,1,2,3,...)
- **Tile assembly system:** is a [tile set, seed tile, temperature (0,1,2,3,...)]
- Growth begins from the **seed** tile at (0,0) in \mathbb{Z}^2
- A tile **sticks** to an assembly if enough of its glues match so that the sum of the strengths of the matching glues is at least the **temperature**

Abstract tile assembly model

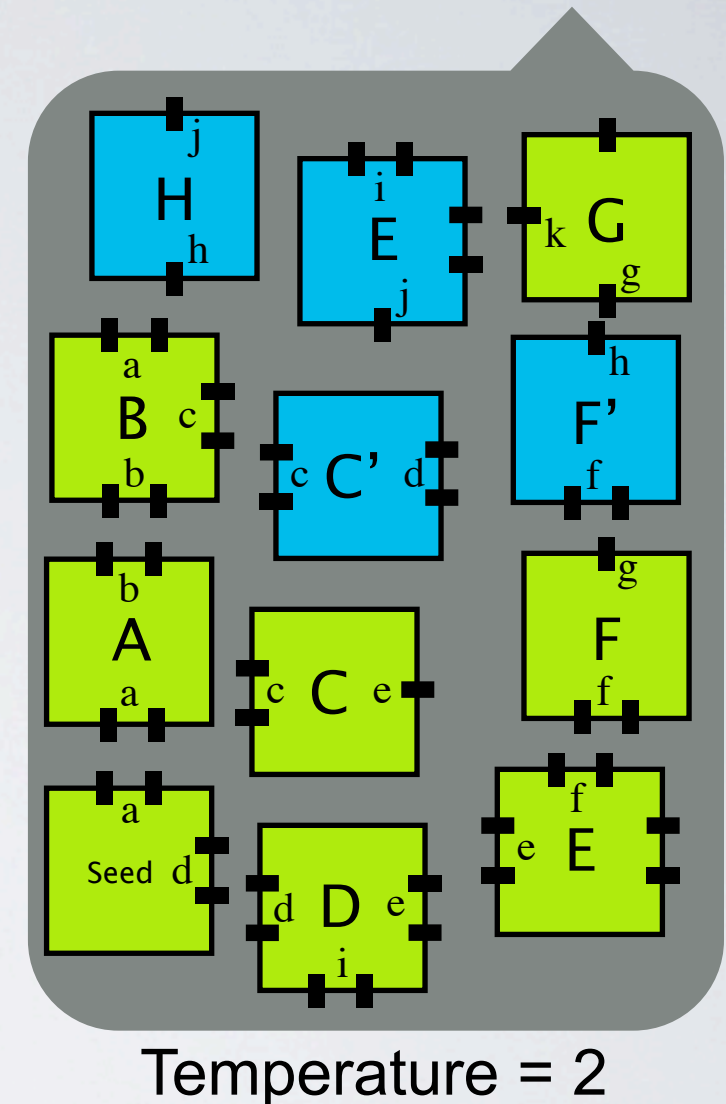

Tile assembly system:
tile set, seed tile, temperature

- Finite set of unit-sized square **tiles**
- non-rotatable, unlimited supply of each tile type
- Each side has a **glue** (a,b,c,d,...)
- Each glue has a **strength** (0,1,2,3,...)
- **Tile assembly system:** is a [tile set, seed tile, temperature (0,1,2,3,...)]
- Growth begins from the **seed** tile at (0,0) in \mathbb{Z}^2
- A tile **sticks** to an assembly if enough of its glues match so that the sum of the strengths of the matching glues is at least the **temperature**

Abstract tile assembly model

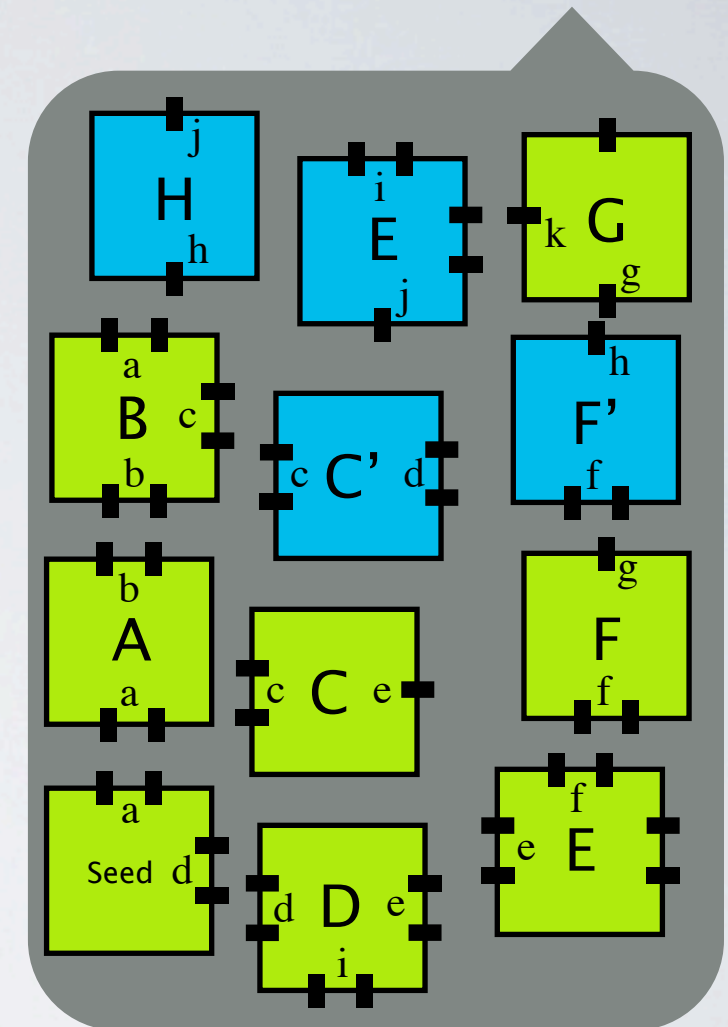

Tile assembly system:
tile set, seed tile, temperature

- Finite set of unit-sized square **tiles**
- non-rotatable, unlimited supply of each tile type
- Each side has a **glue** (a,b,c,d,...)
- Each glue has a **strength** (0,1,2,3,...)
- **Tile assembly system:** is a [tile set, seed tile, temperature (0,1,2,3,...)]
- Growth begins from the **seed** tile at (0,0) in \mathbb{Z}^2
- A tile **sticks** to an assembly if enough of its glues match so that the sum of the strengths of the matching glues is at least the **temperature**

Abstract tile assembly model

Tile assembly system:
tile set, seed tile, temperature

Temperature = 2

- Finite set of unit-sized square **tiles**
- non-rotatable, unlimited supply of each tile type
- Each side has a **glue** (a,b,c,d,...)
- Each glue has a **strength** (0,1,2,3,...)
- **Tile assembly system:** is a [tile set, seed tile, temperature (0,1,2,3,...)]
- Growth begins from the **seed** tile at (0,0) in \mathbb{Z}^2
- A tile **sticks** to an assembly if enough of its glues match so that the sum of the strengths of the matching glues is at least the **temperature**

Abstract tile assembly model

Tile assembly system:
tile set, seed tile, temperature

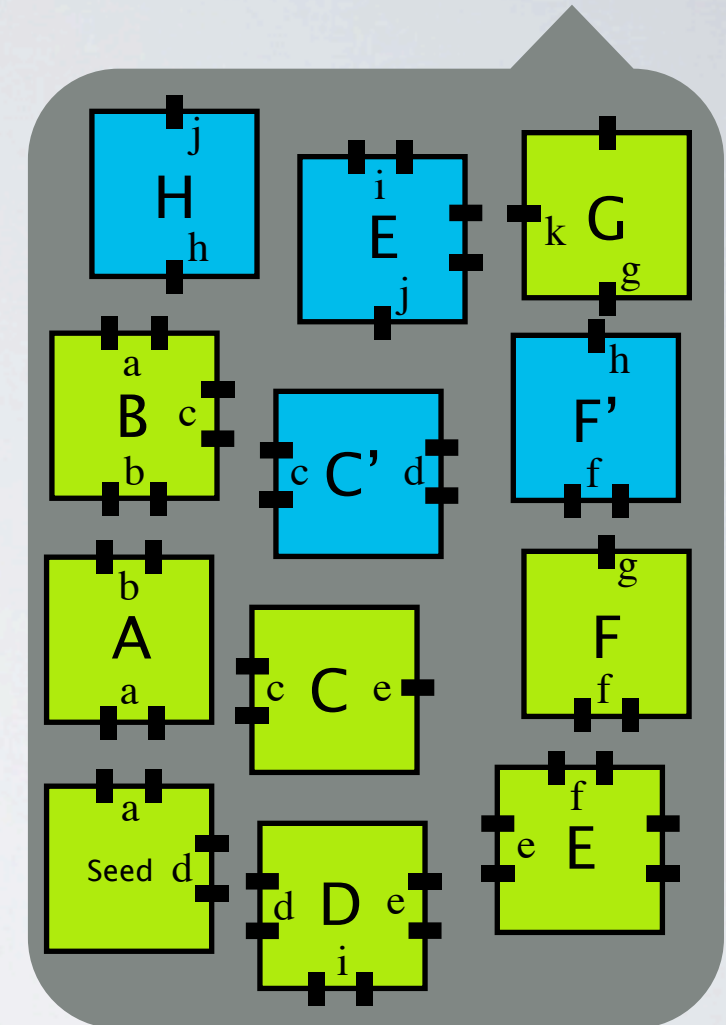

Temperature = 2

- Finite set of unit-sized square **tiles**
- non-rotatable, unlimited supply of each tile type
- Each side has a **glue** (a,b,c,d,...)
- Each glue has a **strength** (0,1,2,3,...)
- **Tile assembly system:** is a [tile set, seed tile, temperature (0,1,2,3,...)]
- Growth begins from the **seed** tile at (0,0) in \mathbb{Z}^2
- A tile **sticks** to an assembly if enough of its glues match so that the sum of the strengths of the matching glues is at least the **temperature**

Abstract tile assembly model

Tile assembly system:
tile set, seed tile, temperature

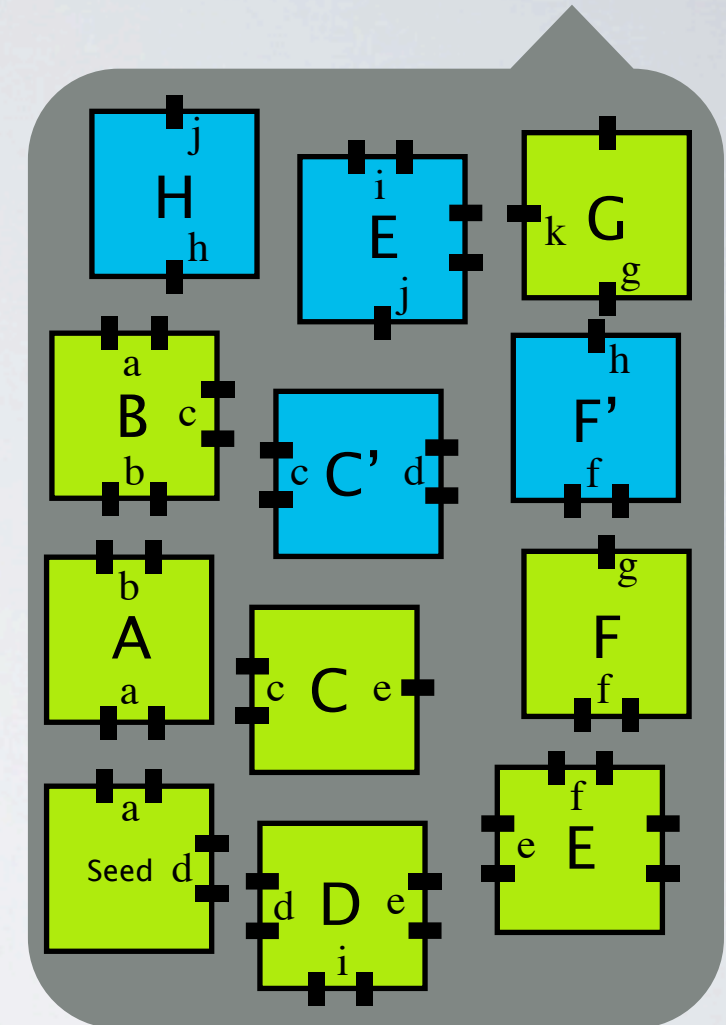

Temperature = 2

- Finite set of unit-sized square **tiles**
- non-rotatable, unlimited supply of each tile type
- Each side has a **glue** (a,b,c,d,...)
- Each glue has a **strength** (0,1,2,3,...)

Defn. Tile assembly system: tile set, seed tile, temperature

Winfree, 1998

Algorithmic self-assembly with tiles: computation and geometry

Barish, Rothmund, Winfree 2005

Rothmund, Papadakis, Winfree 2004

Barish, Schulman Rothmund, Winfree 2009

- Seeman built tiles out of DNA in the laboratory
- Winfree showed that DNA tiles can run algorithms (much like cellular automata, Wang tiles)
- A variety of algorithmic tile assembly systems have been built from DNA

Barish, Schulman Rothmund, Winfree 2009

Computation with tile assembly

- Turing universality

Winfree, 1998

- Efficient assembly of simple shapes

- E.g. $n \times n$ squares using $\Theta(\log n / \log \log n)$ tile types

Rothemund, Winfree. STOC 2000

- Efficient assembly of complicated connected shapes using a number of tile types roughly equal to the Kolmogorov complexity of the shape

Soloveichik, Winfree. SICOMP 2007

Intrinsic universality

<http://otcametapixel.blogspot.com/>
<http://www.youtube.com/watch?v=xP5-ileKXE8>

Intrinsic universality

<http://otcametapixel.blogspot.com/>
<http://www.youtube.com/watch?v=xP5-ileKXE8>

Intrinsic universality

- Conway's Game of Life is an intrinsically universal cellular automaton

<http://otcametapixel.blogspot.com/>

<http://www.youtube.com/watch?v=xP5-ileKXE8>

Intrinsic universality

- An intrinsically universal CA is one that “simulates” any other:
 - Appropriate encoding
 - Encodes all properties of the simulated CA, up to rescaling

“Just gliders”

Rule 184

Rule 184 simulates “Just gliders” via a time and space rescaling (encoding)
Stolen, and vertically flipped, from G. Theyssier’s slides

- Theory of intrinsic universality in CA
- Applications:
 - separating class of cellular automata based on their simulation abilities
 - use of non-intrinsic universality results to prove that certain cellular automata are “computationally weak”

Is the abstract tile assembly model intrinsically universal?

Is the abstract tile assembly model intrinsically universal?

Yes!

Is the abstract tile assembly model intrinsically universal?

Yes!

There is a single universal tile set U that
simulates *any* tile assembly system

tile set

Our journey

aTAM, $\tau \geq 2$ (IU [11])

Simulation definition

- We want a definition of simulation that captures the notion of one Tile Assembly System simulating the “behaviour” of another
- \mathcal{T} is a (any) simulated tile assembly system,
 - $\mathcal{T} = (\text{tileset } T, \text{ seed assembly } \sigma, \text{ temperature } \tau)$
- Tile assembly system $\mathcal{U}_\tau = (U, \sigma_\tau, 2)$ simulates \mathcal{T} if:
 - Tiles from T are simulated by $m \times m$ supertiles in \mathcal{U}_τ , i.e., a representation function R maps supertiles in assemblies of \mathcal{U}_τ to tiles in T . Oh, and R is “clean”.
 - The producible assemblies in \mathcal{U}_τ represent exactly the producible assemblies in \mathcal{T} .
 - Ignoring $m \times m$ scaling, dynamics are equivalent in \mathcal{U}_τ & \mathcal{T} .

Is the abstract tile assembly model intrinsically universal?

Yes!

Theorem: There is a single universal tile set U that simulates *any* tile assembly system

Doty, Lutz, Patitz, Schweller, Summers, Woods. FOCS 2012

Temperature = 2

Universal
tile set

Our journey

aTAM, $\tau \geq 2$ (IU [11])

Theorem: There is a **single** rotatable polygon that simulates **all** tile assembly systems

Theorem: For each (Wang) plane tile system there is one rotatable polygon that simulates it

Robinson's 10-tile aperiodic tile set

A rotatable polygon that simulates a tile set

- For each set of (possibly rotatable, flipable) Wang square/hexagon tiles there is a single rotatable tile that simulates it

A rotatable polygon that simulates a tile set

- For each set of (possibly rotatable, flipable) Wang square/hexagon tiles there is a single rotatable tile that simulates it

Robinson's 10-tile aperiodic tile set
(complimentary matching constraint)

A rotatable polygon that simulates a tile set

- For each set of (possibly rotatable, and/or flipable) square or hexagon tiles there is a single (rotatable, flipable) tile that simulates it

Robinson's 10-tile aperiodic tile set
(complimentary matching constraint)

- An aperiodic tile set with 1 tile!
- Small gaps in the tilings
- We have given a general method (a compiler) to convert any square/hexagon plane tiling tile set to a single tile that simulates it
- So we can have a single tile that is aperiodic, or a single tile that simulates a universal Turing machine, etc.

A harder challenge: one tile for all of tile self-assembly

- Simulating tile assembly systems is significantly trickier than plane (Wang) tiling systems
- We want to design a single rotatable, flipable tile that simulates any tile assembly system
- Strength tau glues on rotatable tiles => Argh! There's pumpable junk everywhere!
- So lets not use strength tau glues on The One.
- Maybe we could find an intrinsically universal square tile set with strength $< \tau$ glues?
 - No! Any such tile set with a finite seed can not leave the seed's bounding box
 - Lets try hexagons!

Low strength hexes simulate high-strength squares

- Strength 1 or 0 hexagon glues, simulating strength 2, 1 or 0 square glues

- The we can simulate a set of low-strength hexagons with a single rotatable polygon
 - Bumps and dents to stop incorrect orientations and incorrect bindings
 - Glues are carefully rearranged on the polygon to allow “self seeding”
 - Many details omitted!

Our journey

Our journey

Our journey

Temperature 1 tile assembly

- Temperature 1 tile assembly systems:
 - Each glue has strength 0 or 1
 - Tile binds to an assembly if ≥ 1 glues match with strength = 1
 - Snakes on a plane

Temperature 1 tile assembly

- Temperature 1 tile assembly systems:
 - Each glue has strength 0 or 1
 - Tile binds to an assembly if ≥ 1 glues match with strength = 1
 - Snakes on a plane

Is temperature 1 computationally weak?

- It has been conjectured (since 2000) that temperature 1 systems are “computationally weak”
Rothemund, Winfree. STOC 2000
- Some negative results:
 - Temperature 1 systems that build **fully connected** $n \times n$ squares require at least n^2 tile types
Rothemund, Winfree. STOC 2000
 - **Pumpable** temperature 1 systems produce only periodic structures
Doty, Patitz, Summers. TCS 2011
 - Temperature 1 with **no mismatches** require $2n-1$ tile types to assemble an $n \times n$ square
Manuch, Stacho, Stoll. J Comp. Bio. 2010
- Positive results:
 - 3D deterministic temperature 1 simulates Turing machines
Cook, Fu Schweller. SODA 2011
 - 2D temperature 1 simulates Turing machine, but with some error
Cook, Fu Schweller. SODA 2011
- It remains open whether temperature 1 (aka noncooperative) tile assembly systems can simulate Turing machines deterministically in 2D, whether they can efficiently build squares or other shapes, etc.
- But can they do tile assembly? I.e. can they simulate cooperative tile assembly?
- No!
Meunier, Patitz, Summers, Theyssier, Winslow, Woods. SODA 2014

Temperature 1 is not IU for the aTAM

- We will show that no temperature 1 system simulates the following simple temperature 2 system

(a)

(b)

(c)

Equal arm lengths

(d)

Unequal arm lengths

Temperature 1 is not IU for the aTAM

- First we prove a kind of strong pumping lemma for tile assembly (that holds at any temperature)

- We then use this pumping lemma to “fool” any claimed temperature 1 simulator into exposing its inability to simulate cooperation

Temperature 1 is not IU for the aTAM

- There are simple temperature 2 systems that can not be simulated by any temperature 1 system
Meunier, Patitz, Summers, Theyssier, Winslow, Woods. SODA 2014
- First fully-general negative result on temperature 1
- This negative result holds in 2D and 3D
- Recall: Deterministic 3D temperature 1 systems can simulate Turing machines!
Cook, Fu Schweller. SODA 2011
- So these Turing-universal (powerful!) tile assembly systems can not simulate tile assembly
- **Turing universal algorithmic behavior in self-assembly provably does not imply the ability to simulate arbitrary algorithmic self-assembly processes**
- We walked into Mordor, and survived

Our journey

Our journey

Conclusions

- 1. There is an intrinsically universal tile set:
 - i.e. there is a single tile set that can simulate any tile assembly system
- 2. There is a single rotatable polygon that can simulate any tile assembly system, or Turing machine
- 3. There is an aperiodic rotatable polygonal tile
- 4. Intrinsic universality can be used to separate, and classify, the power of self-assembly systems:

- Temperature 1 can not simulate temperature 2 and above
- Infinite set, of infinite hierarchies of hierarchical self-assembly systems (2HAM)
- Other cool results that I have not mentioned:

- Simulations between tile assembly and CA

Hendricks, Patitz, MCU, 2013

- Two-handed 3D tile set is IU for the 2D Signal-Passing tile assembly model

Hendricks, Padilla, Patitz and Rogers, DNA, 2013

- 3D Temperature 1 can simulate 2D Temperature 1

Meunier, Patitz, Summers, Theyssier, Winslow, Woods. SODA 2014

- The restricted “locally consistent” tile assembly systems are intrinsic universal

Doty, Lutz, Patitz, Summers, Woods, STACS 2010

Open questions

- 1. Are the following models intrinsically universal?
 - hexagonal tile assembly model, polygonal tile assembly model, nubots, signal-passing tile assembly model
- 2. Is there a tile set $U_{\text{crazy fool}}$ that does nothing but simulate members from a “large” class of tile assembly systems?
- 3. Can we show that no 2D temperature 1 system can deterministically (correctly) simulate temperature 2 “zig-zag” tile assembly systems?

Thanks!

Jack Lutz Matthew Patitz Dave Doty Scott Summers Robert Schweller
